## **Annual Updates and Special Installation Functions:**

### **Intersect Systems Records Management Software Systems**

Intersect System's Records Management series of software applications are developed with Microsoft's software development systems. The applications are updated annually, with distribution to customers who participate in the ASP Annual Support Program

Developed and refined over the past eighteen years, the Intersect applications are periodically re-implemented to take advantage of the latest software methods and tools.

#### **Windows XP, Vista, and 7 Compatibility**

The latest update to the Retention Schedule Manager series includes Intersect's new Smart Installer. Smart Installer makes a single installation program compatible with Windows XP, Vista, or 7.

Microsoft guidelines for installations on Windows platforms specify different installation locations for various application components depending on the Windows operating system version on the target computer system. The Smart Installer determines the operating system that is running on the computer platform at the start of the installation process. This allows the Smart Installer to install the executable files, DLL's, and other components in the directories specified by Microsoft for correct installations.

#### **Wide Screen Monitors**

The new 2010 Intersect applications releases have new functions to accommodate wide-screen monitors that are being acquired by some organizations. During initial execution start-up, applications such as the Retention Schedule Manager determine the aspect ratio of the current monitor connected to the computer, and perform special scaling functions on application form components to maintain the full-screen display that Intersect Systems' applications are noted for.

Further, on each subsequent start-up, the applications check to see if the monitor aspect ratio has changed. If the monitor has been changed, the application performs the scaling functions again to accommodate the new monitor / aspect ratio, thereby automatically accommodating monitor changes on a computer system.
